Tennis Group Project

Samuel Stockman, Angie Gray, Jack Simons

10/12/2020

Let's first load in the relevant data (see tennis.R)

```
file_list = list.files()
```

Now we want to compile the data into a better format. We need the input variables which should be equal to something of the form: variables = c('surface', 'winner_id', 'loser_id', 'loser_age', 'winner_age') - alternatively if it left blank then we will load all the variables

```
load_data <- function(file_list, variables=FALSE) {
  no_files <- length(file_list)
  for (file_index in 1:no_files) {
    temp_file <- read.csv(file_list[[file_index]])
    if (class(variables)=="character") {
        temp_file <- subset(temp_file, select = variables)
    }
    if (file_index==1) {
        melted_files <- temp_file
    } else {
        melted_files <- rbind(melted_files, temp_file)
    }
}
return(melted_files)
}</pre>
```

Let's now use this function

```
# variables <- c('surface', 'winner_id', 'loser_id', 'winner_age', 'loser_age')
my_data <- load_data(file_list)</pre>
```

Let's see what the data looks like

```
head(my_data, 30)
```

```

                                                        848
```

Now, for the logistic regression. We need to create our $D = \{(\boldsymbol{x}_i, y_i)\}_{i=1}^n$

We need an activation function

```
activ_func <- function(t) {
  return(1/(1+exp(t)))
}</pre>
```
